Nonclinical Tools in Drug Development:

Current Challenges and the Path Forward

March 26, 2025

11:00am-1:00pm ET | 4:00-6:00pm CET

LEAVITT PARTNERS
An HMA Company

LEAVITT PARTNERS
An HMA Company

Agenda

- Welcome
- Keynote Remarks: Dr. Andrew von Eschenbach
- Where are we now? Setting the Stage
- Challenges for industry and next steps moving forward
- Q&A

Moderated by:

Maria Apostolaros

Deputy Vice President

Science and Regulatory Advocacy

P*h*RMA

Keynote Address

Andrew von Eschenbach, M.D

President, Samaritan Health Initiatives;

Urologic Oncologist

Former Director of the National Cancer Institute

Former Commissioner of the Food and Drug Administration

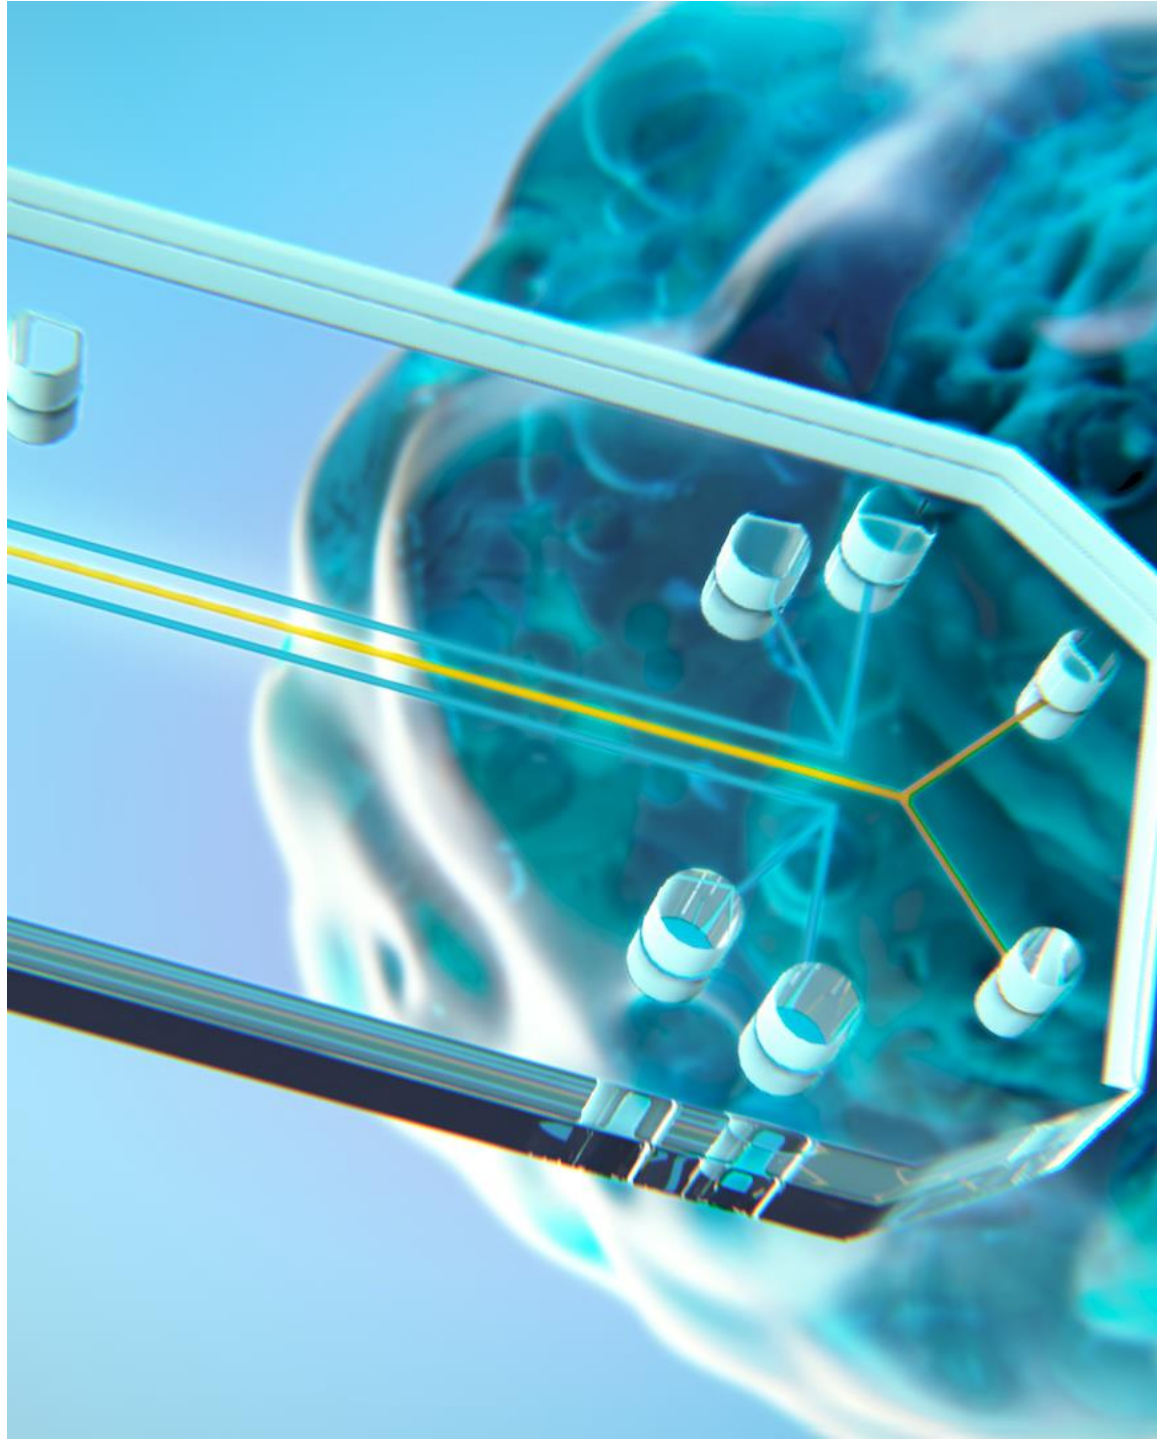
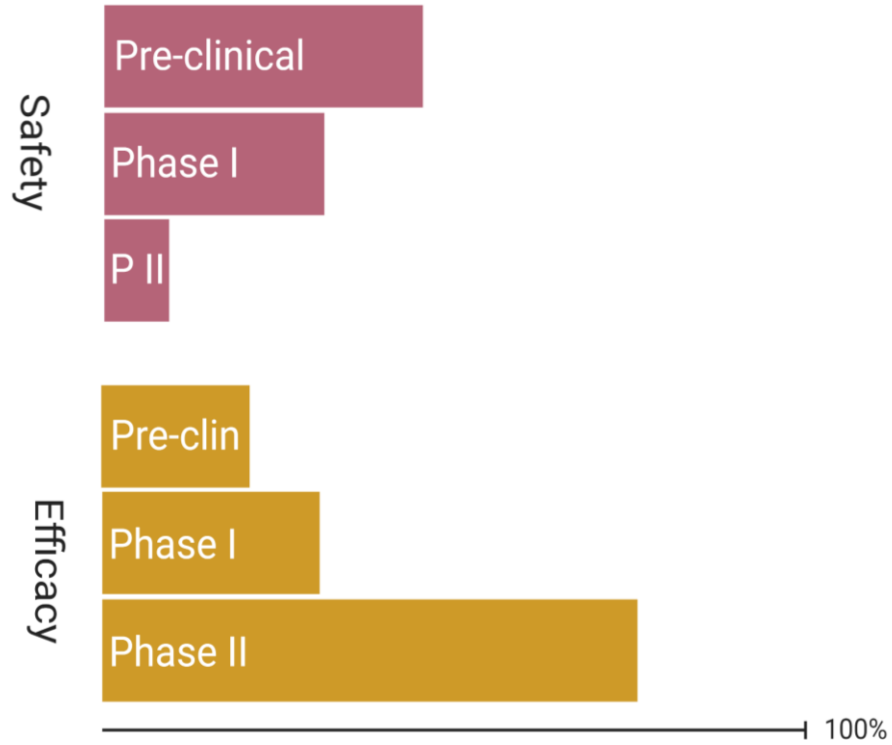
Clinical Pharmacology and Safety Sciences, R&D, AstraZeneca, Cambridge, UK

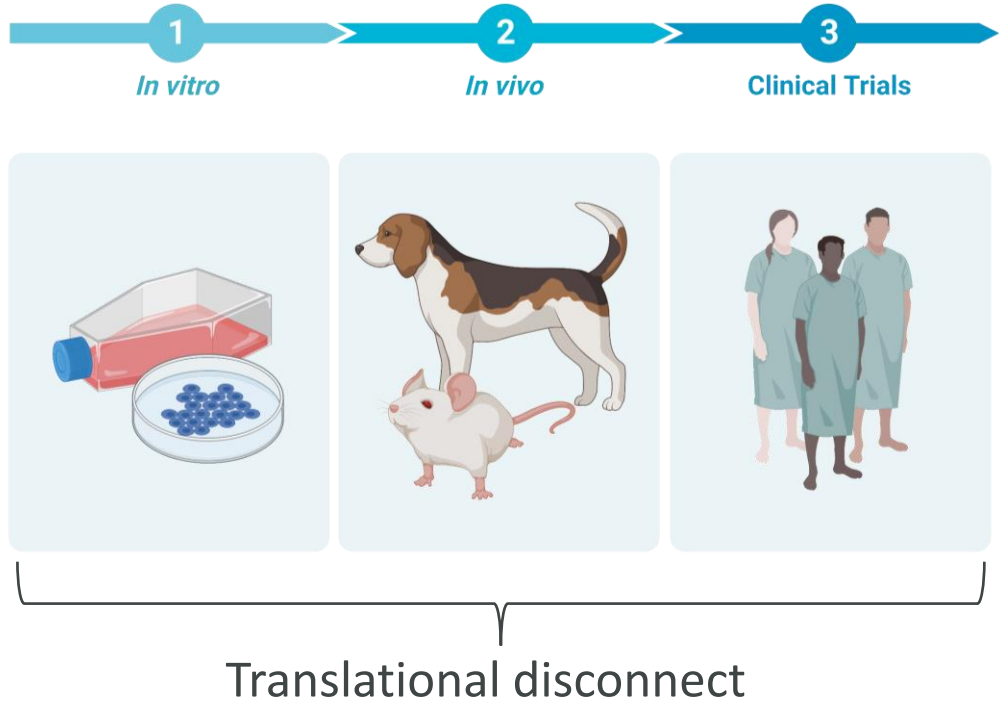
26th March 2025



Enhancing pre-clinical safety assessment in drug development

Drug attrition is a major problem despite improvement in safety-related attrition





Translational disconnect

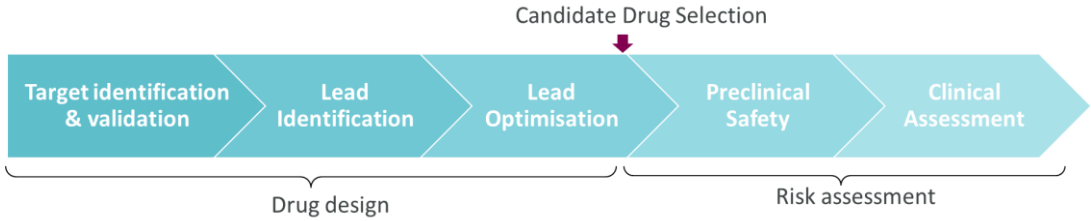
To reduce drug attrition and select more successful drug candidates, we need more human-relevant pre-clinical models

Created with BioRender.com

Morgan, P., Brown, D., Lennard, S. et al. Impact of a five-dimensional framework on R&D productivity at AstraZeneca. Nat Rev Drug Discov 17, 167–181 (2018).

Re-imagining pre-clinical drug development

Safety must be designed in before candidate selection



The Candidate Drug is **THE** molecule

All **molecular properties** are **fixed** (including those driving tox)

Safety must be designed in **before** selecting the candidate

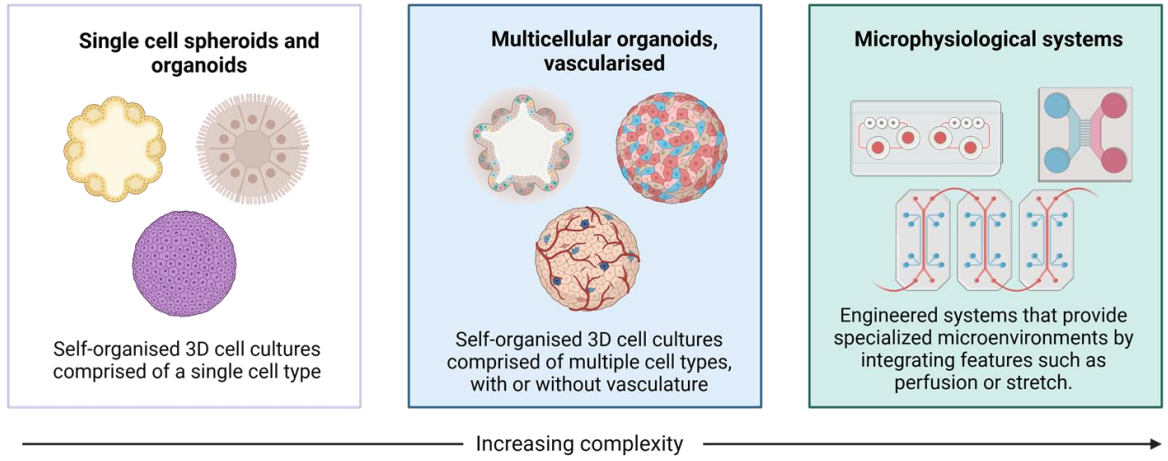
Build **translational understanding** of remaining target/ compound safety risks for clinical prediction

Integrate Human Advanced Cell Models for improved clinical translation

Multiple cell types and organ systems

Less drug used compared to *in vivo*

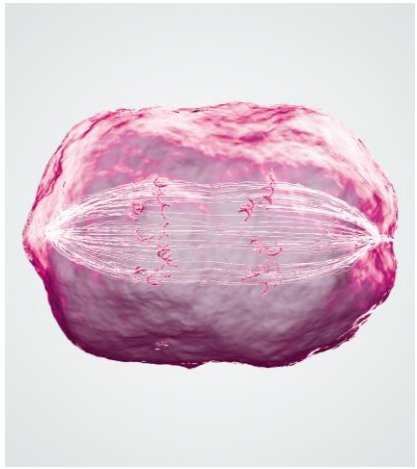
Human cells/tissues for more relevant models



9 J.J. Hornberg and T. Mow (2014) *Future Med Chem* 6: 481-3.
J.J. Hornberg et al (2014) *Drug Discov Today* 19: 1131-6.

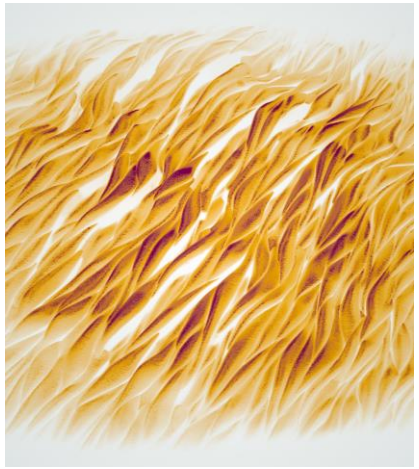
Created with BioRender.com

Advanced Cell Models: an opportunity to improve pre-clinical safety assessment



Longevity of cell culture

Enables detection of chronic effects or repeat dosing

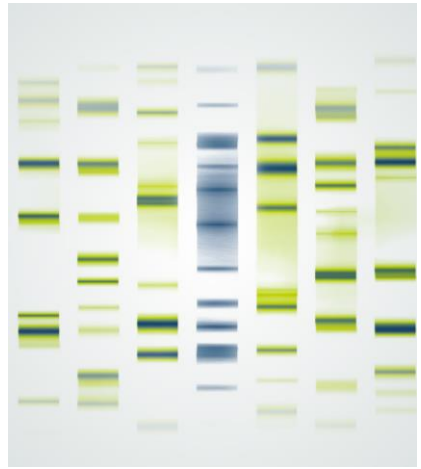


Mixed cell populations

Enable cell-cell interactions/ feedback loops important for organ function/ drug responses

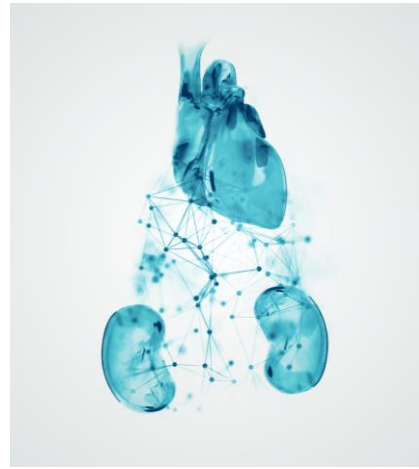
Primary/ iPS cells

More closely resemble cell type of origin



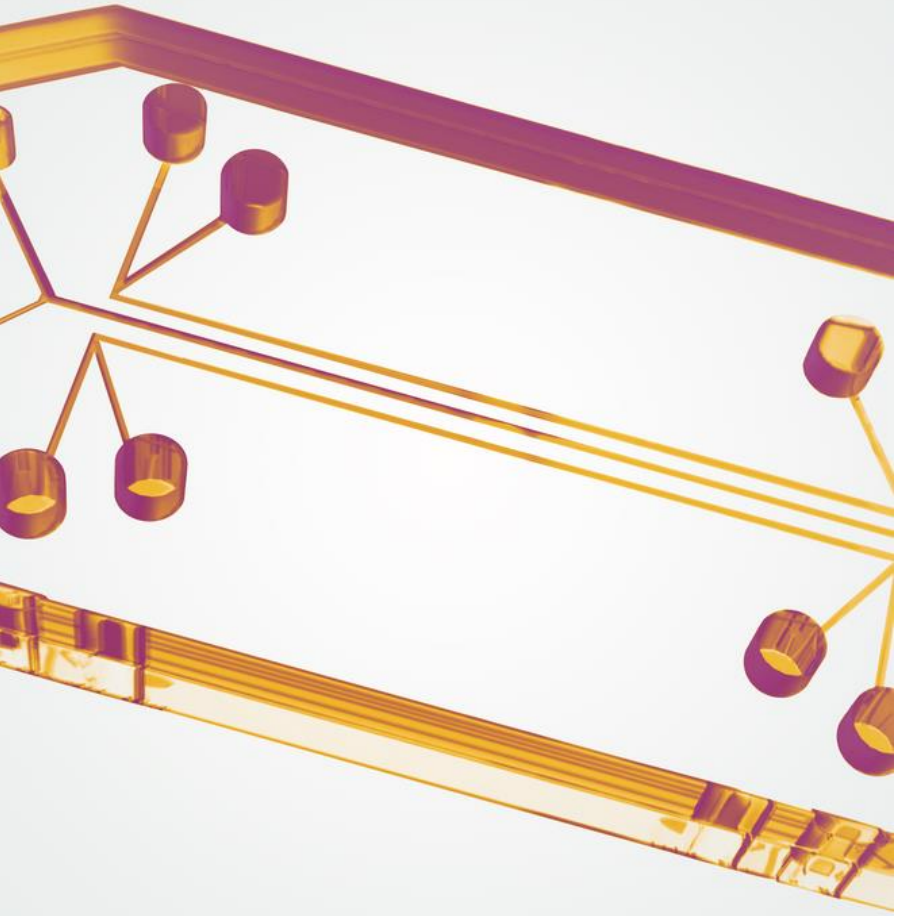
Species differences

Human models could improve clinical translation /animal models could address species differences

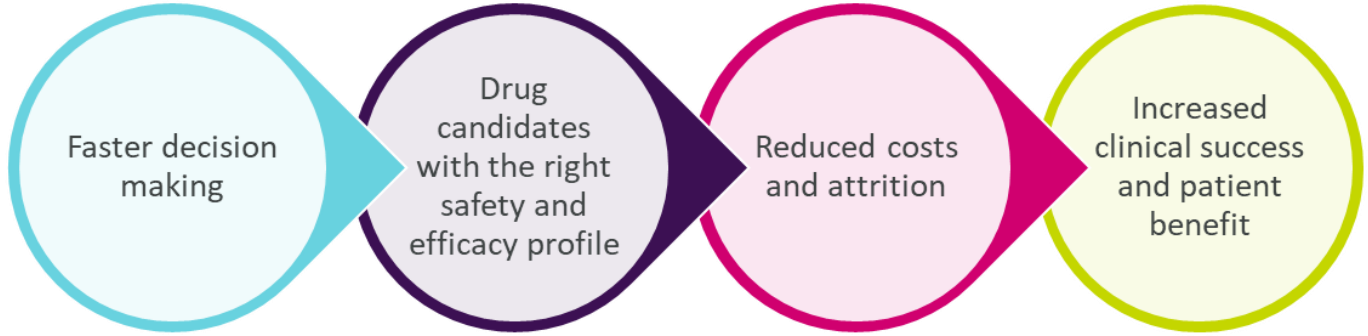


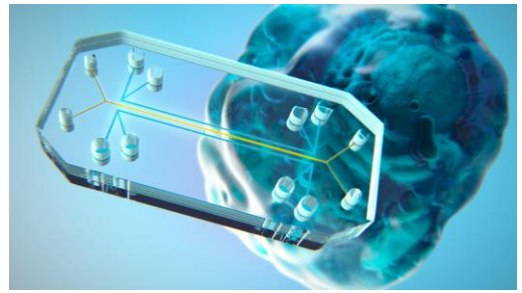
Multiple organs

Drugs can be tested in different organs to determine tissue-specificity of effects



Redefining safety and efficacy prediction with Human Advanced Cell Models





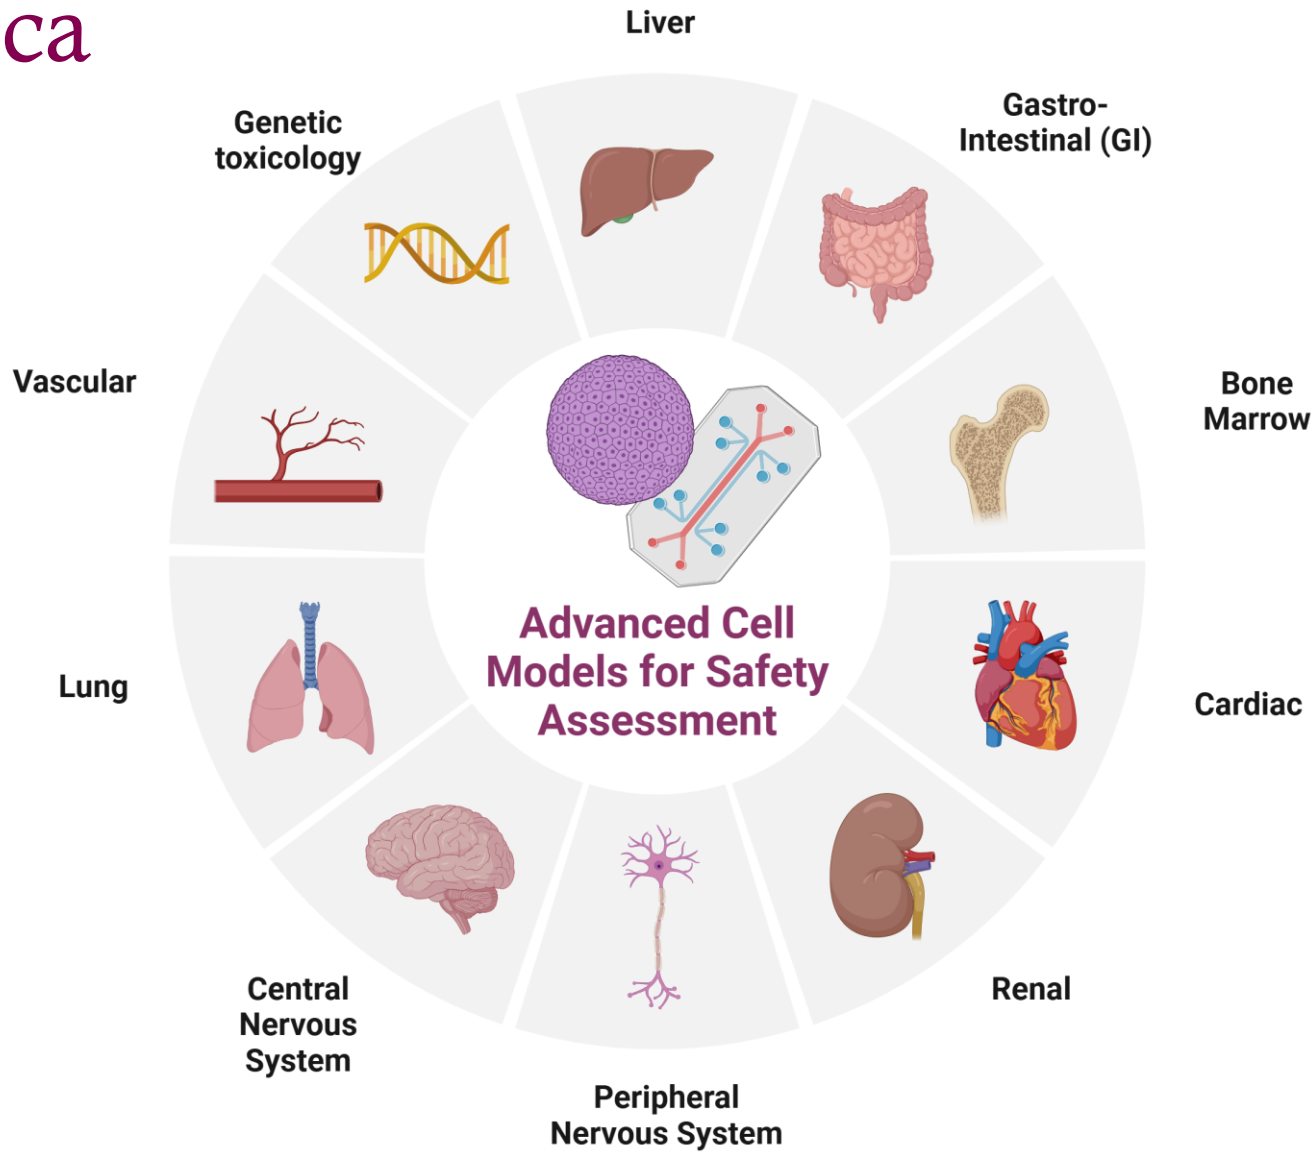
Enhance

- Mechanistic understanding

Enable

- Clinical translation
- 3Rs

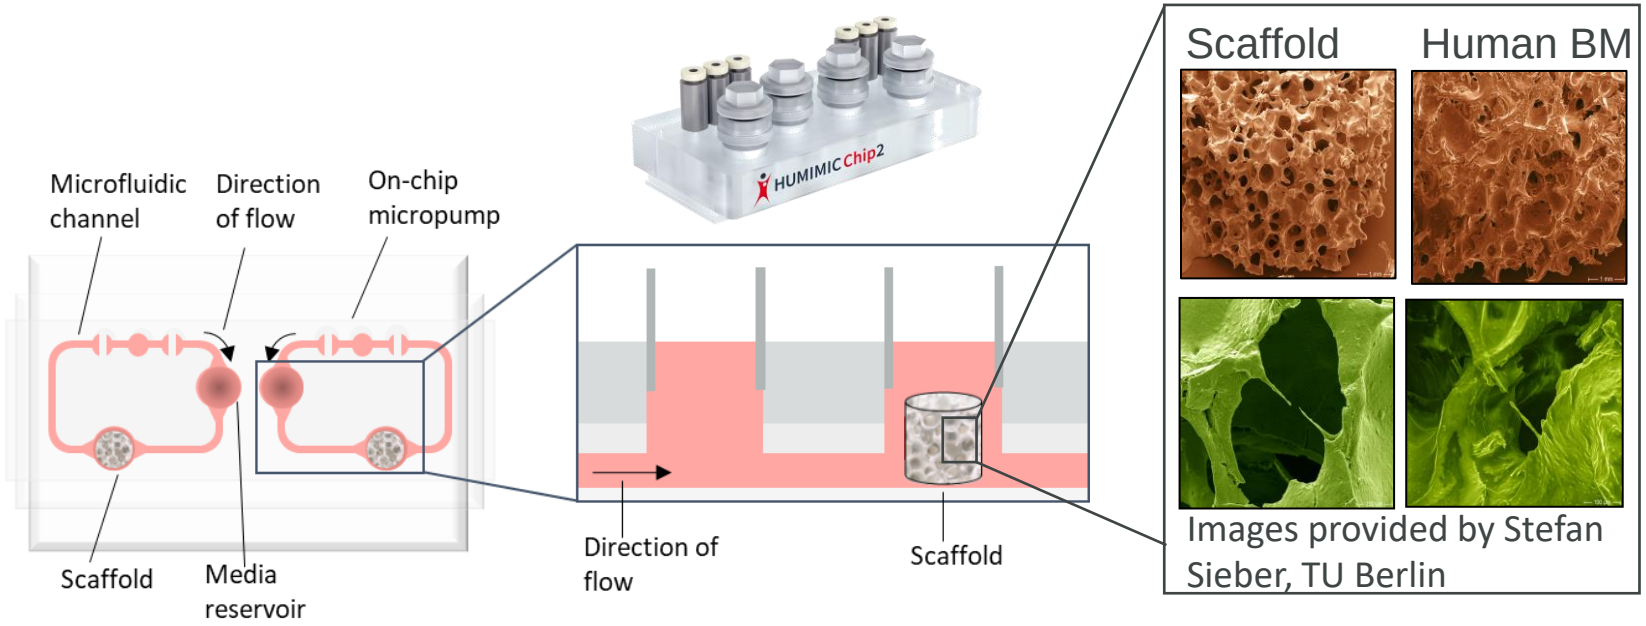
Advanced Cell Models for Safety Assessment in AstraZeneca

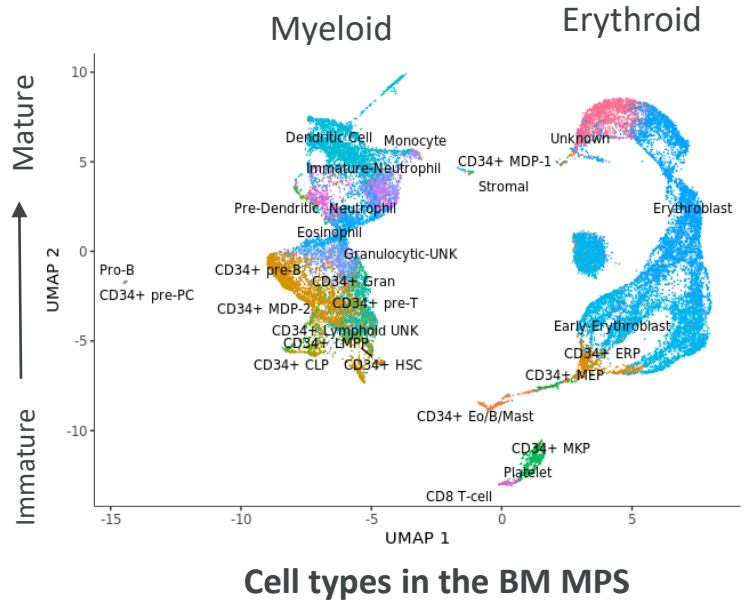


Created in https://BioRender.com

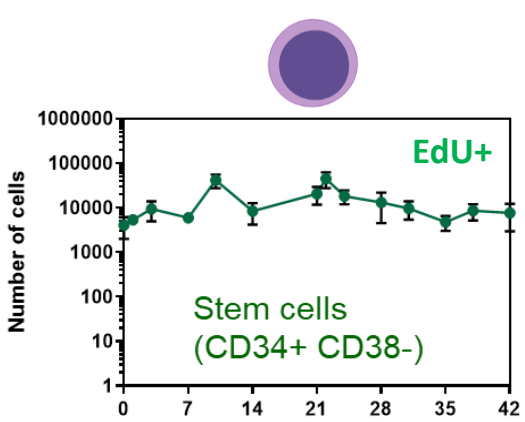
Bone Marrow MPS

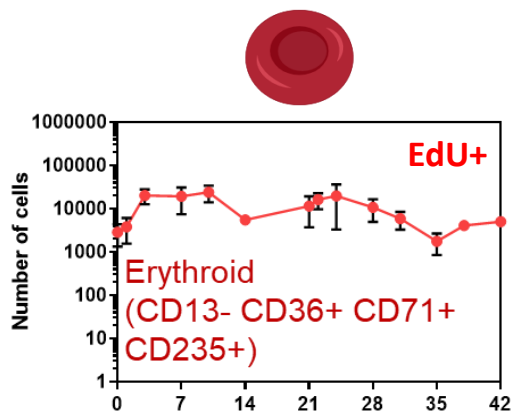
TISSUSE
Emulating Human Biology

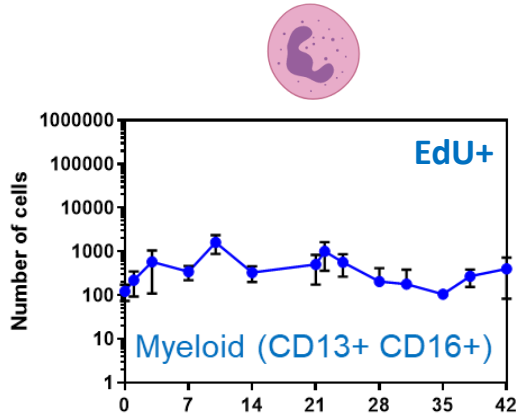


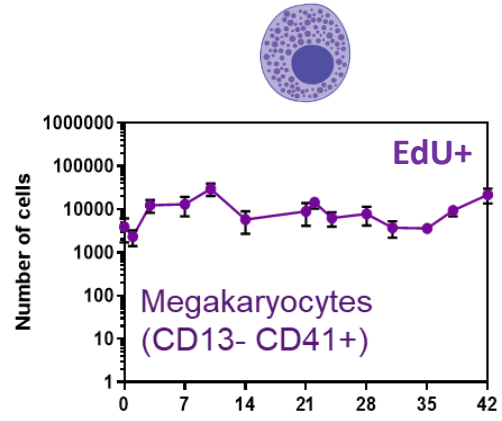


Cell types in the BM MPS



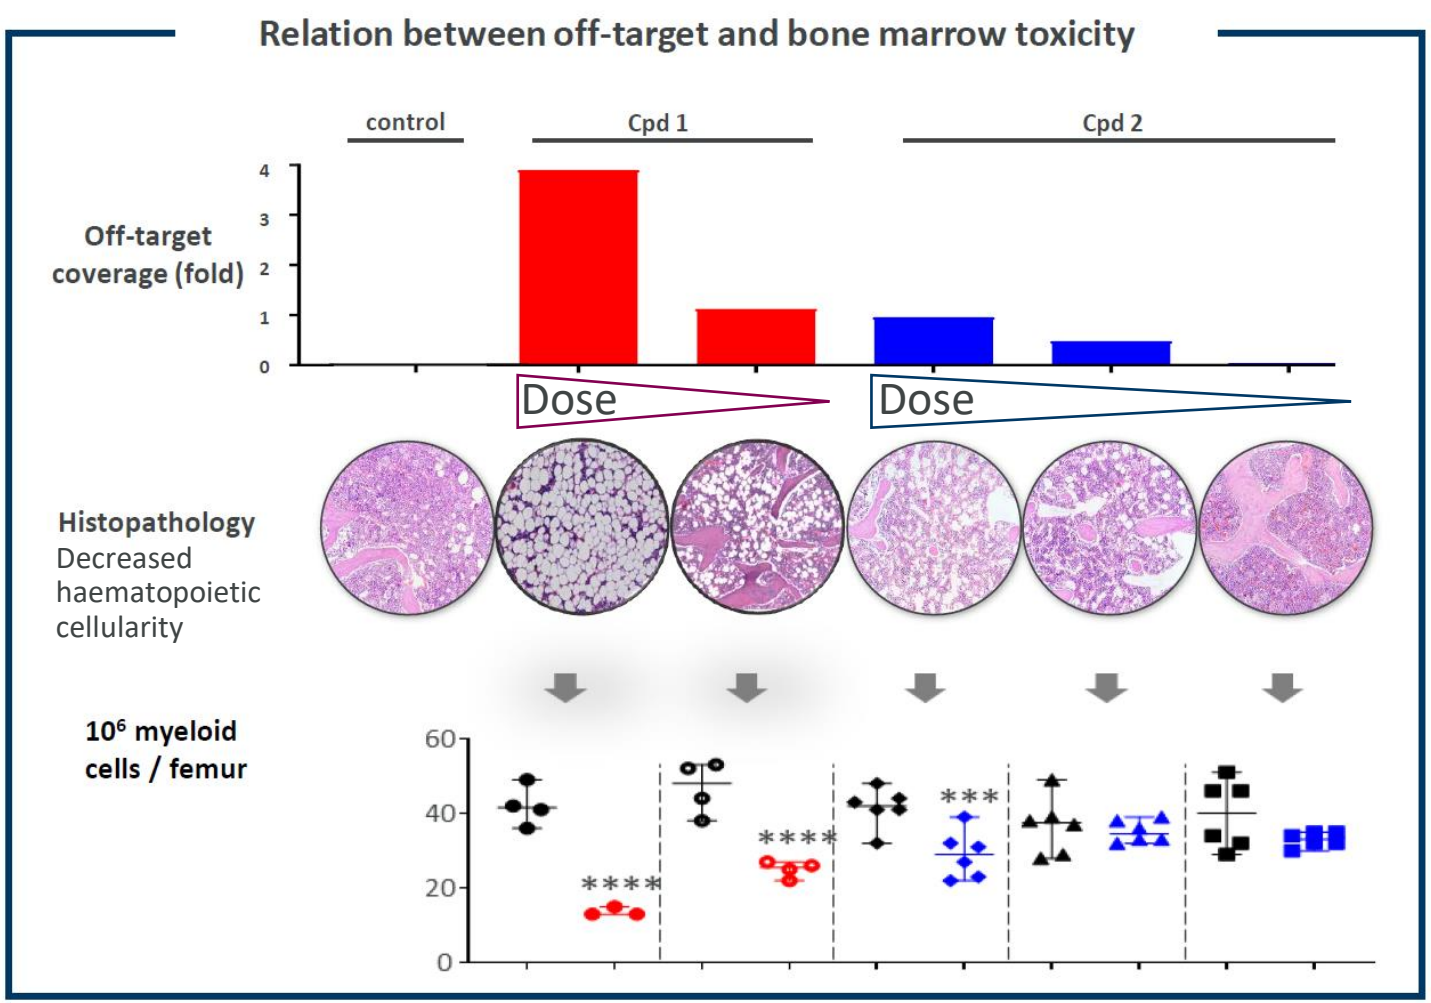


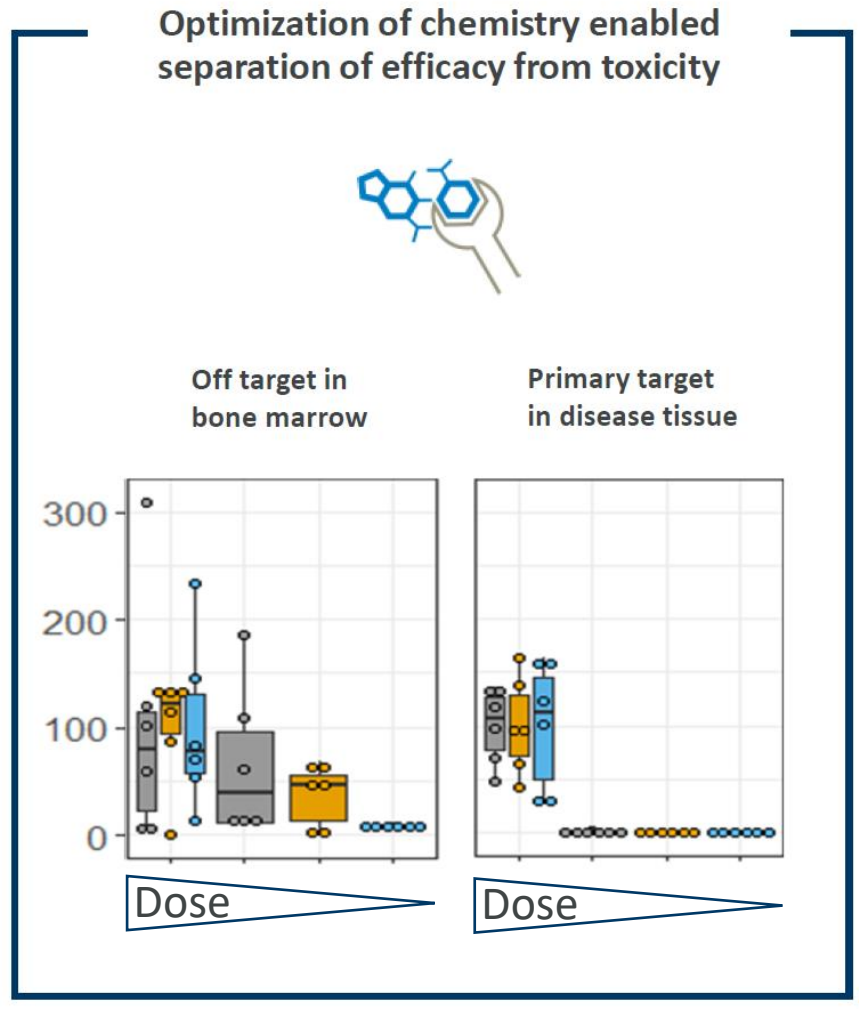




Influencing MONOTHERAPY go/no-go portfolio decisions with quantitative predictions of therapeutic index pre-CDID
Influencing COMBINATION trial optimisation and acceleration to avoid costly clinical investigation of dose and schedule

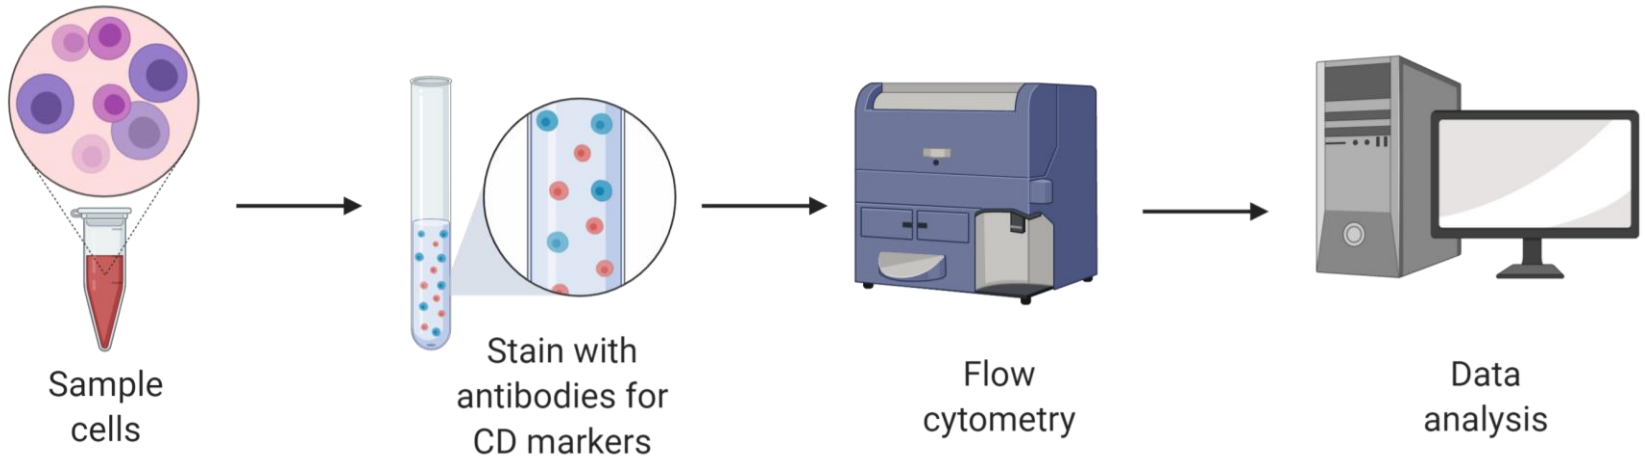
Off-target identification informs chemical optimisation



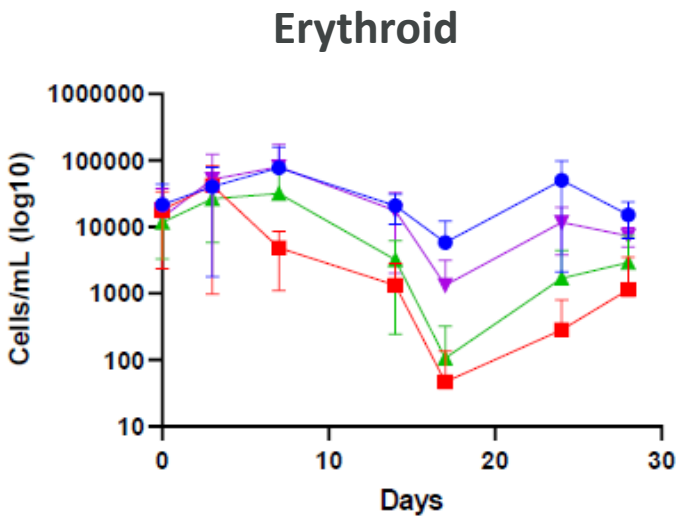


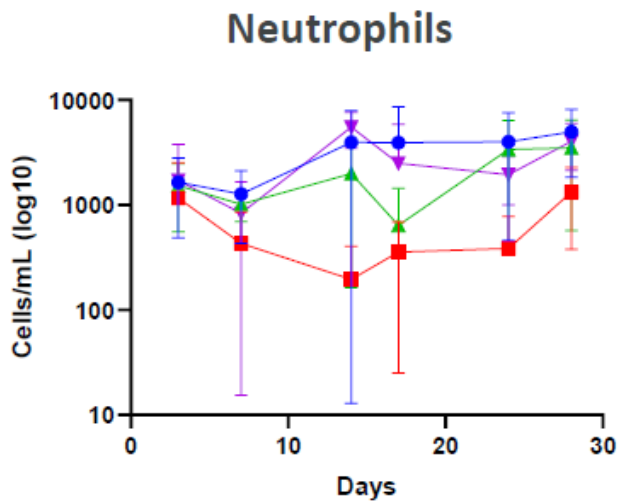
Potential heamatotoxicity risk – will this translate to patients?

Effect recapitulated in bone marrow MPS



28 day study | Continuous treatment





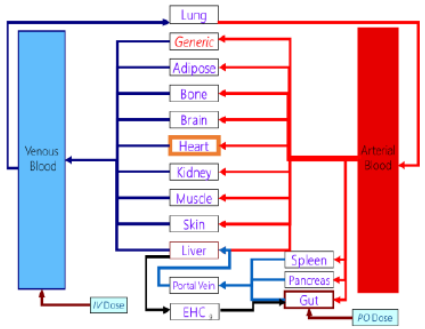
Measure of toxicity over time

What would we see in patients?

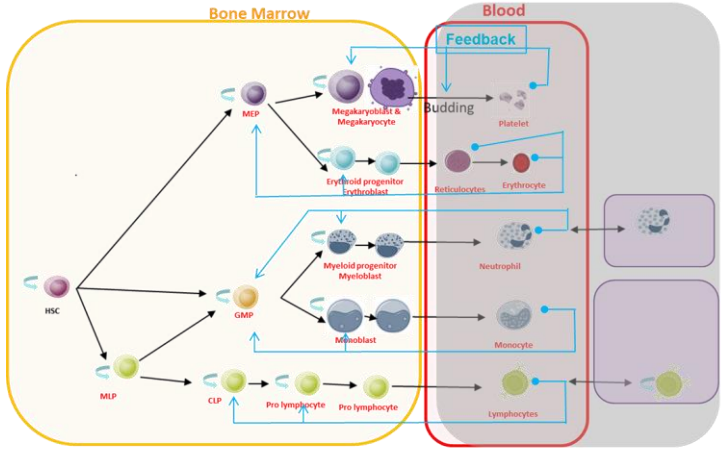
Clinical translation: Quantitative Systems Toxicology Modelling

Systems model of patients' hematology

Exposure: human PK/PBPK model



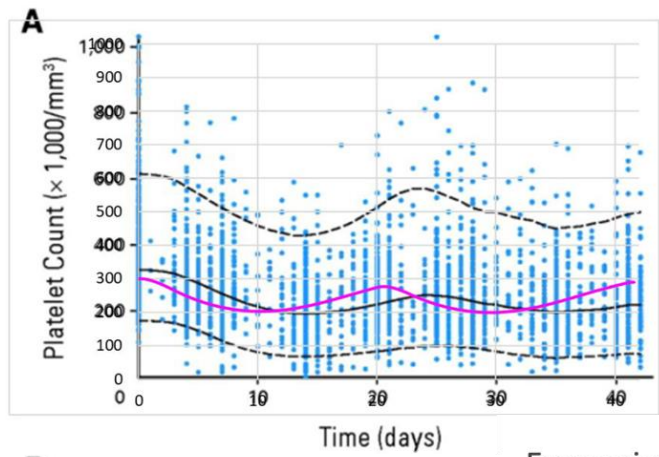
Human haematopoietic model



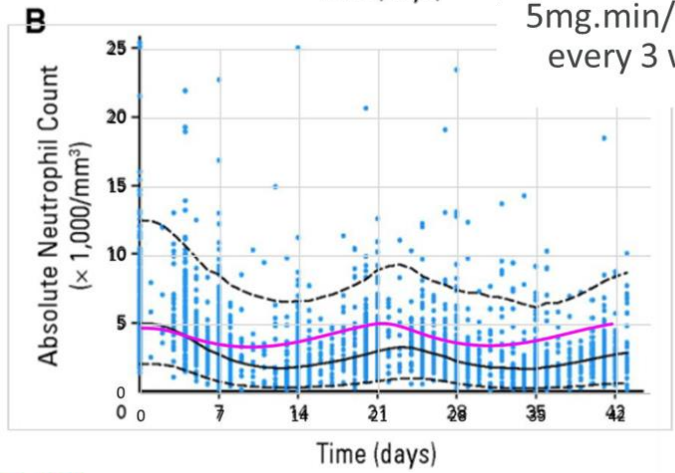
MPS QST model: progenitor cell dynamics

Human QST Haematopoiesis model:
Progenitor and circulating cell dynamics with feedback loops

Does it work?



5mg.min/ml AUC every 3 weeks

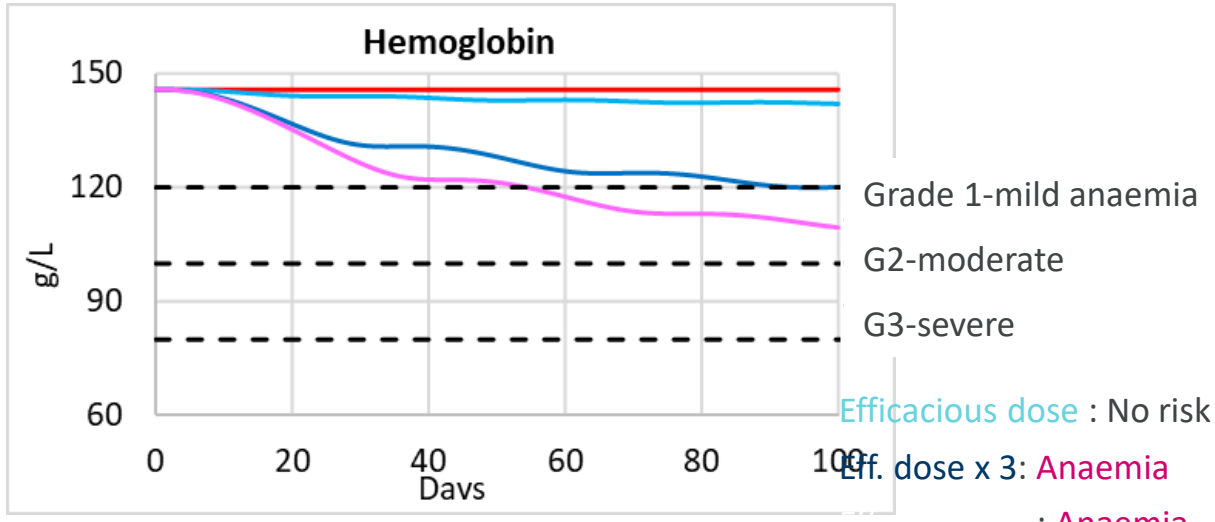


Pink lines are model predictions based on MPS data
Blue dots and **black lines** are data from Schmitt (2010), J Clin Oncol.

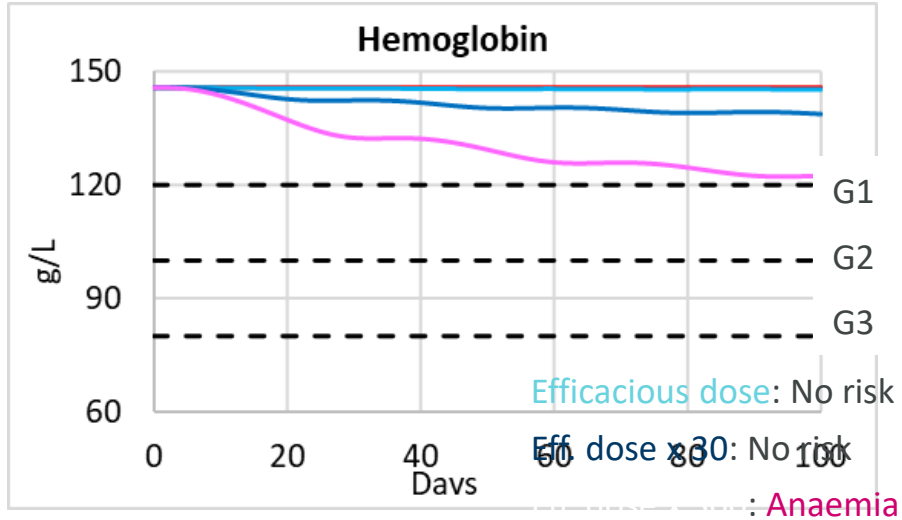
Our modelling approach, based on MPS data, predicts improved safety margin

MPS data-based systems model of patients' hematology expressed as clinical grade of toxicity

Compound 1



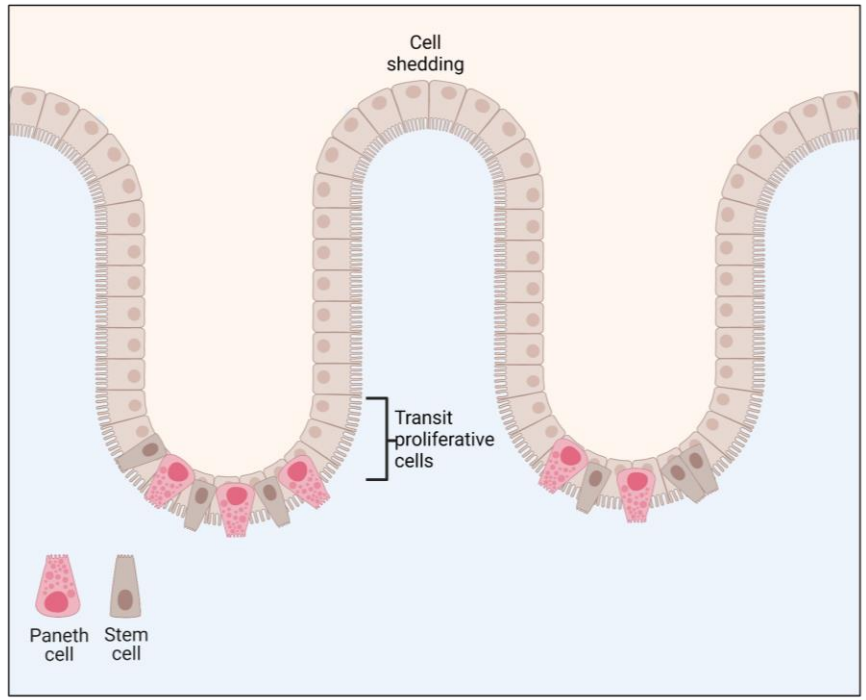
Compound 2



BM MPS coupled with translational mathematical modelling enables early quantitative prediction of clinical haematological risk

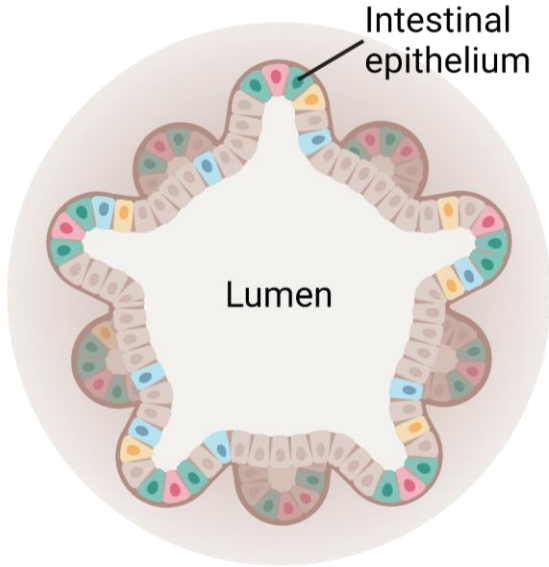
Modelling the intestinal epithelium to detect oncology drug effects

Intestinal crypt



- Compartmentalised, dynamic system
- Makes it very amenable to computational modelling

Model intestine *in vitro*: Organoids



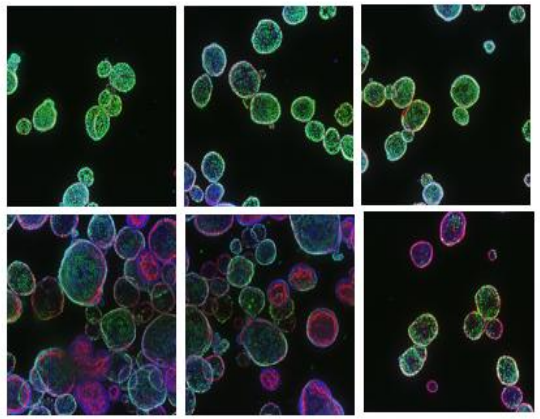
T. Sato, Keio University, Tokyo

- Mimic crypt and are highly proliferative
- A good model to study oncology drug effects
- We use computational modelling to translate toxicity in GI organoids to clinical endpoints

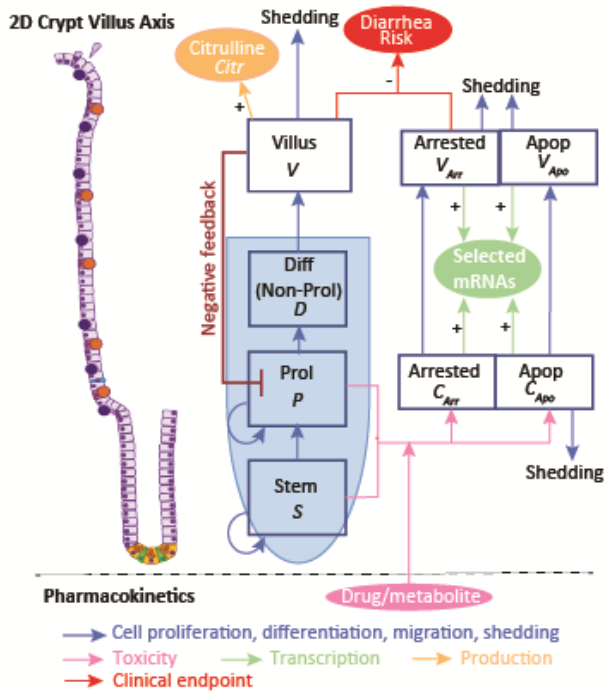
SMALL MOLECULES: Modelling strategy predicts drug associated clinical diarrhea risk based on intestinal organoids

Organoid toxicity modelling

DMSO 0.1 µM 5FU 10 µM 5FU

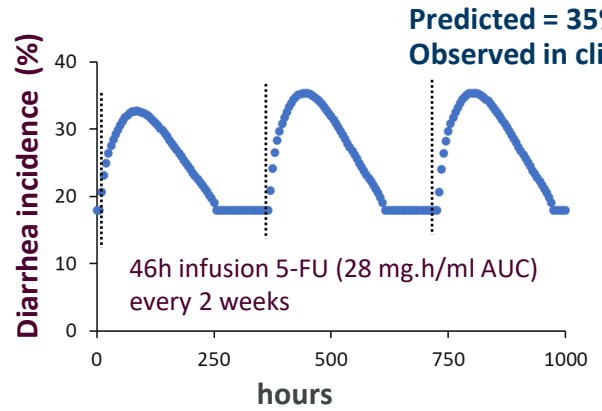


Mathematical model of the human small intestinal epithelium



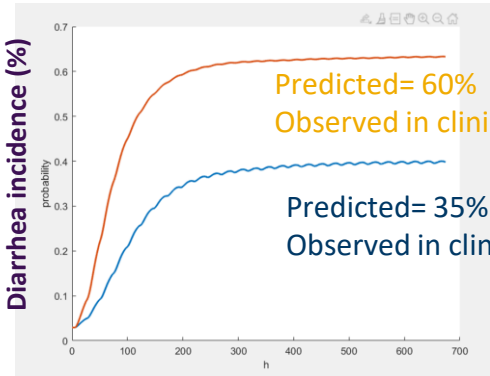
Clinical Diarrhea Risk

Predicted 5FU induced clinical diarrhea



Predicted Gefitinib-induced clinical diarrhea

Gefitinib: 250mg and 500mg QD for 28 days



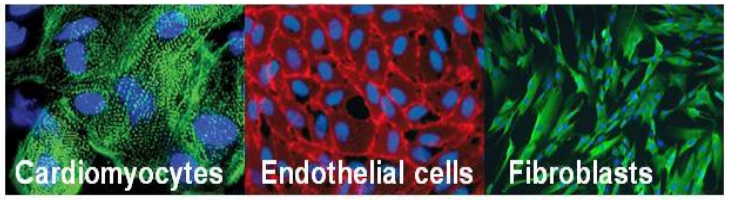
Mouse fails to show GI tox at 50x clinical 500mg equivalent

AstraZeneca: Kenneth Pryde, Louis Gall

TransQST consortium

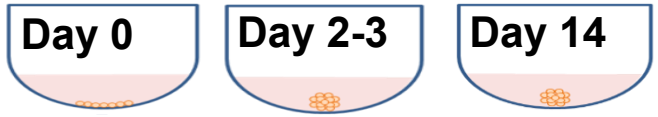
Human Cardiac Microtissues

Humanised Model



Hu-iPS-CM HCMEC HCF

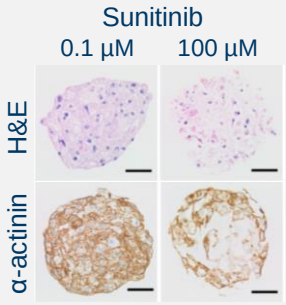
Cells mixed in 4:1:2 ratio



Cell mixture seeded in ULA 384 well plates

Spontaneous beating activity

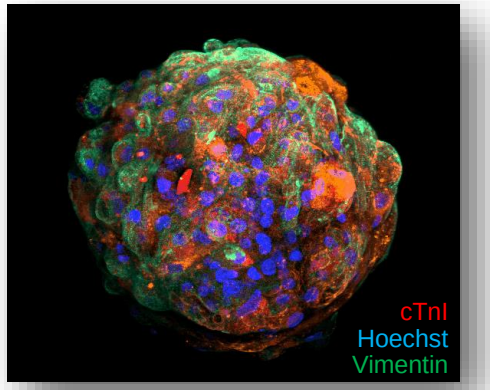
Functional validation



- Lack of hypoxic core
- Morphological integrity maintained for 2 weeks
- Response to cardiotoxins:
  - Loss of cellularity & structural proteins
  - Significant degenerative changes.
  - Release of soluble biomarkers

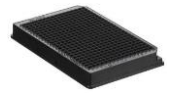
High-Throughput Imaging of Cardiac Microtissues for the Assessment of Cardiac Contraction during Drug Discovery. **Pointon A**, Pilling J, Dorval T, Wang Y, Archer C, Pollard C. Toxicol Sci. 2017 Feb;155(2):444-457.

Characterization and Validation of a Human 3D Cardiac Microtissue for the Assessment of Changes in Cardiac Pathology. Archer CR, Sargeant R, Basak J, Pilling J, Barnes JR, **Pointon A**. Sci Rep. 2018 Jul 5;8(1):10160.



Structural Cardiotoxicity Screen

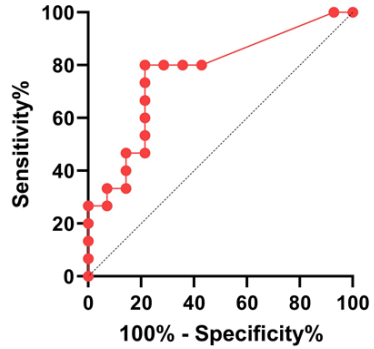
CMT in 384 well plates



- Echo dosing
- 9-point dose curve

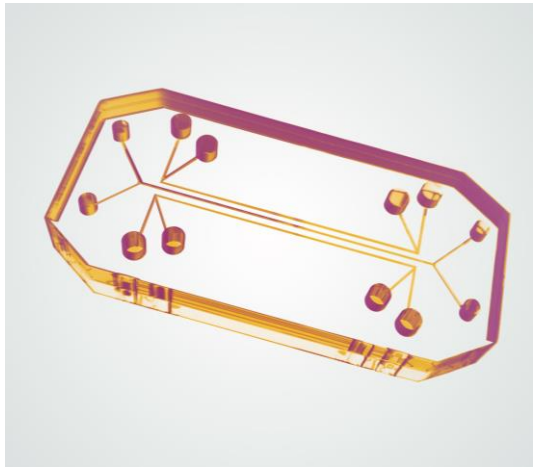
72 h incubation

Mitochondrial membrane potential	Imaging
Endoplasmic reticulum integrity	Imaging
Luminescence-based cell viability	Plate reader



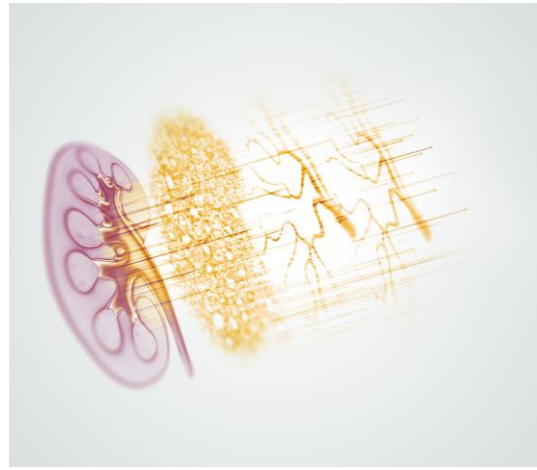
Sensitivity 70%
Specificity 78.6%
Screen shows predictivity of clinical structural cardiotoxicity

Closing remarks



Integration of **Advanced Cell Models** with varying levels of complexity and throughput can **enhance nonclinical safety assessment**

Coupling these models **with QST** modelling can generate **clinical predictions** with reduced data requirements



Combining these models with **advanced technologies can afford novel endpoints** for mechanistic insight to drug toxicity

Challenges to adoption and therefore animal replacement remain

Frederic Christian Pipp

Global Animal Welfare Officer

Merck KGaA

The 3 Basket Approach for a Roadmap to Phase out Animal Testing

Time to Shift Some Paradigms

Dr. Frederic Pipp, Global Animal Welfare Officer
Merck KGaA, Darmstadt, Germany

Today Animal Testing is Part of Most of Our Value Chains

Changing regulations compelling us to replace animals.

2021 EU Parliament
667 MEPs voted for and 4 against

EU parliament adopted resolution for plan and actions to accelerate transition to **innovation without the use of animals in research.**

2022 ECI Requires the European Commission to:

Modernize Science in the EU. Commit to legislative proposals plotting a **roadmap to phase-out animal testing**

2023 NEW EU Pharma Legislation

… including where possible, the use of new approach methodologies […] in **place of animal testing**…

2024 FDA Modernization Act 3.0

… **reduce and replace the use of animals** in nonclinical research, **improving the predictivity** of nonclinical testing methods…

2024 WHO Draft Guideline for QC of Biologics

Guidelines on the phasing out of animal tests for the quality control of biological products

efpia
European Federation of Pharmaceutical Industries and Associations

There is no such thing as

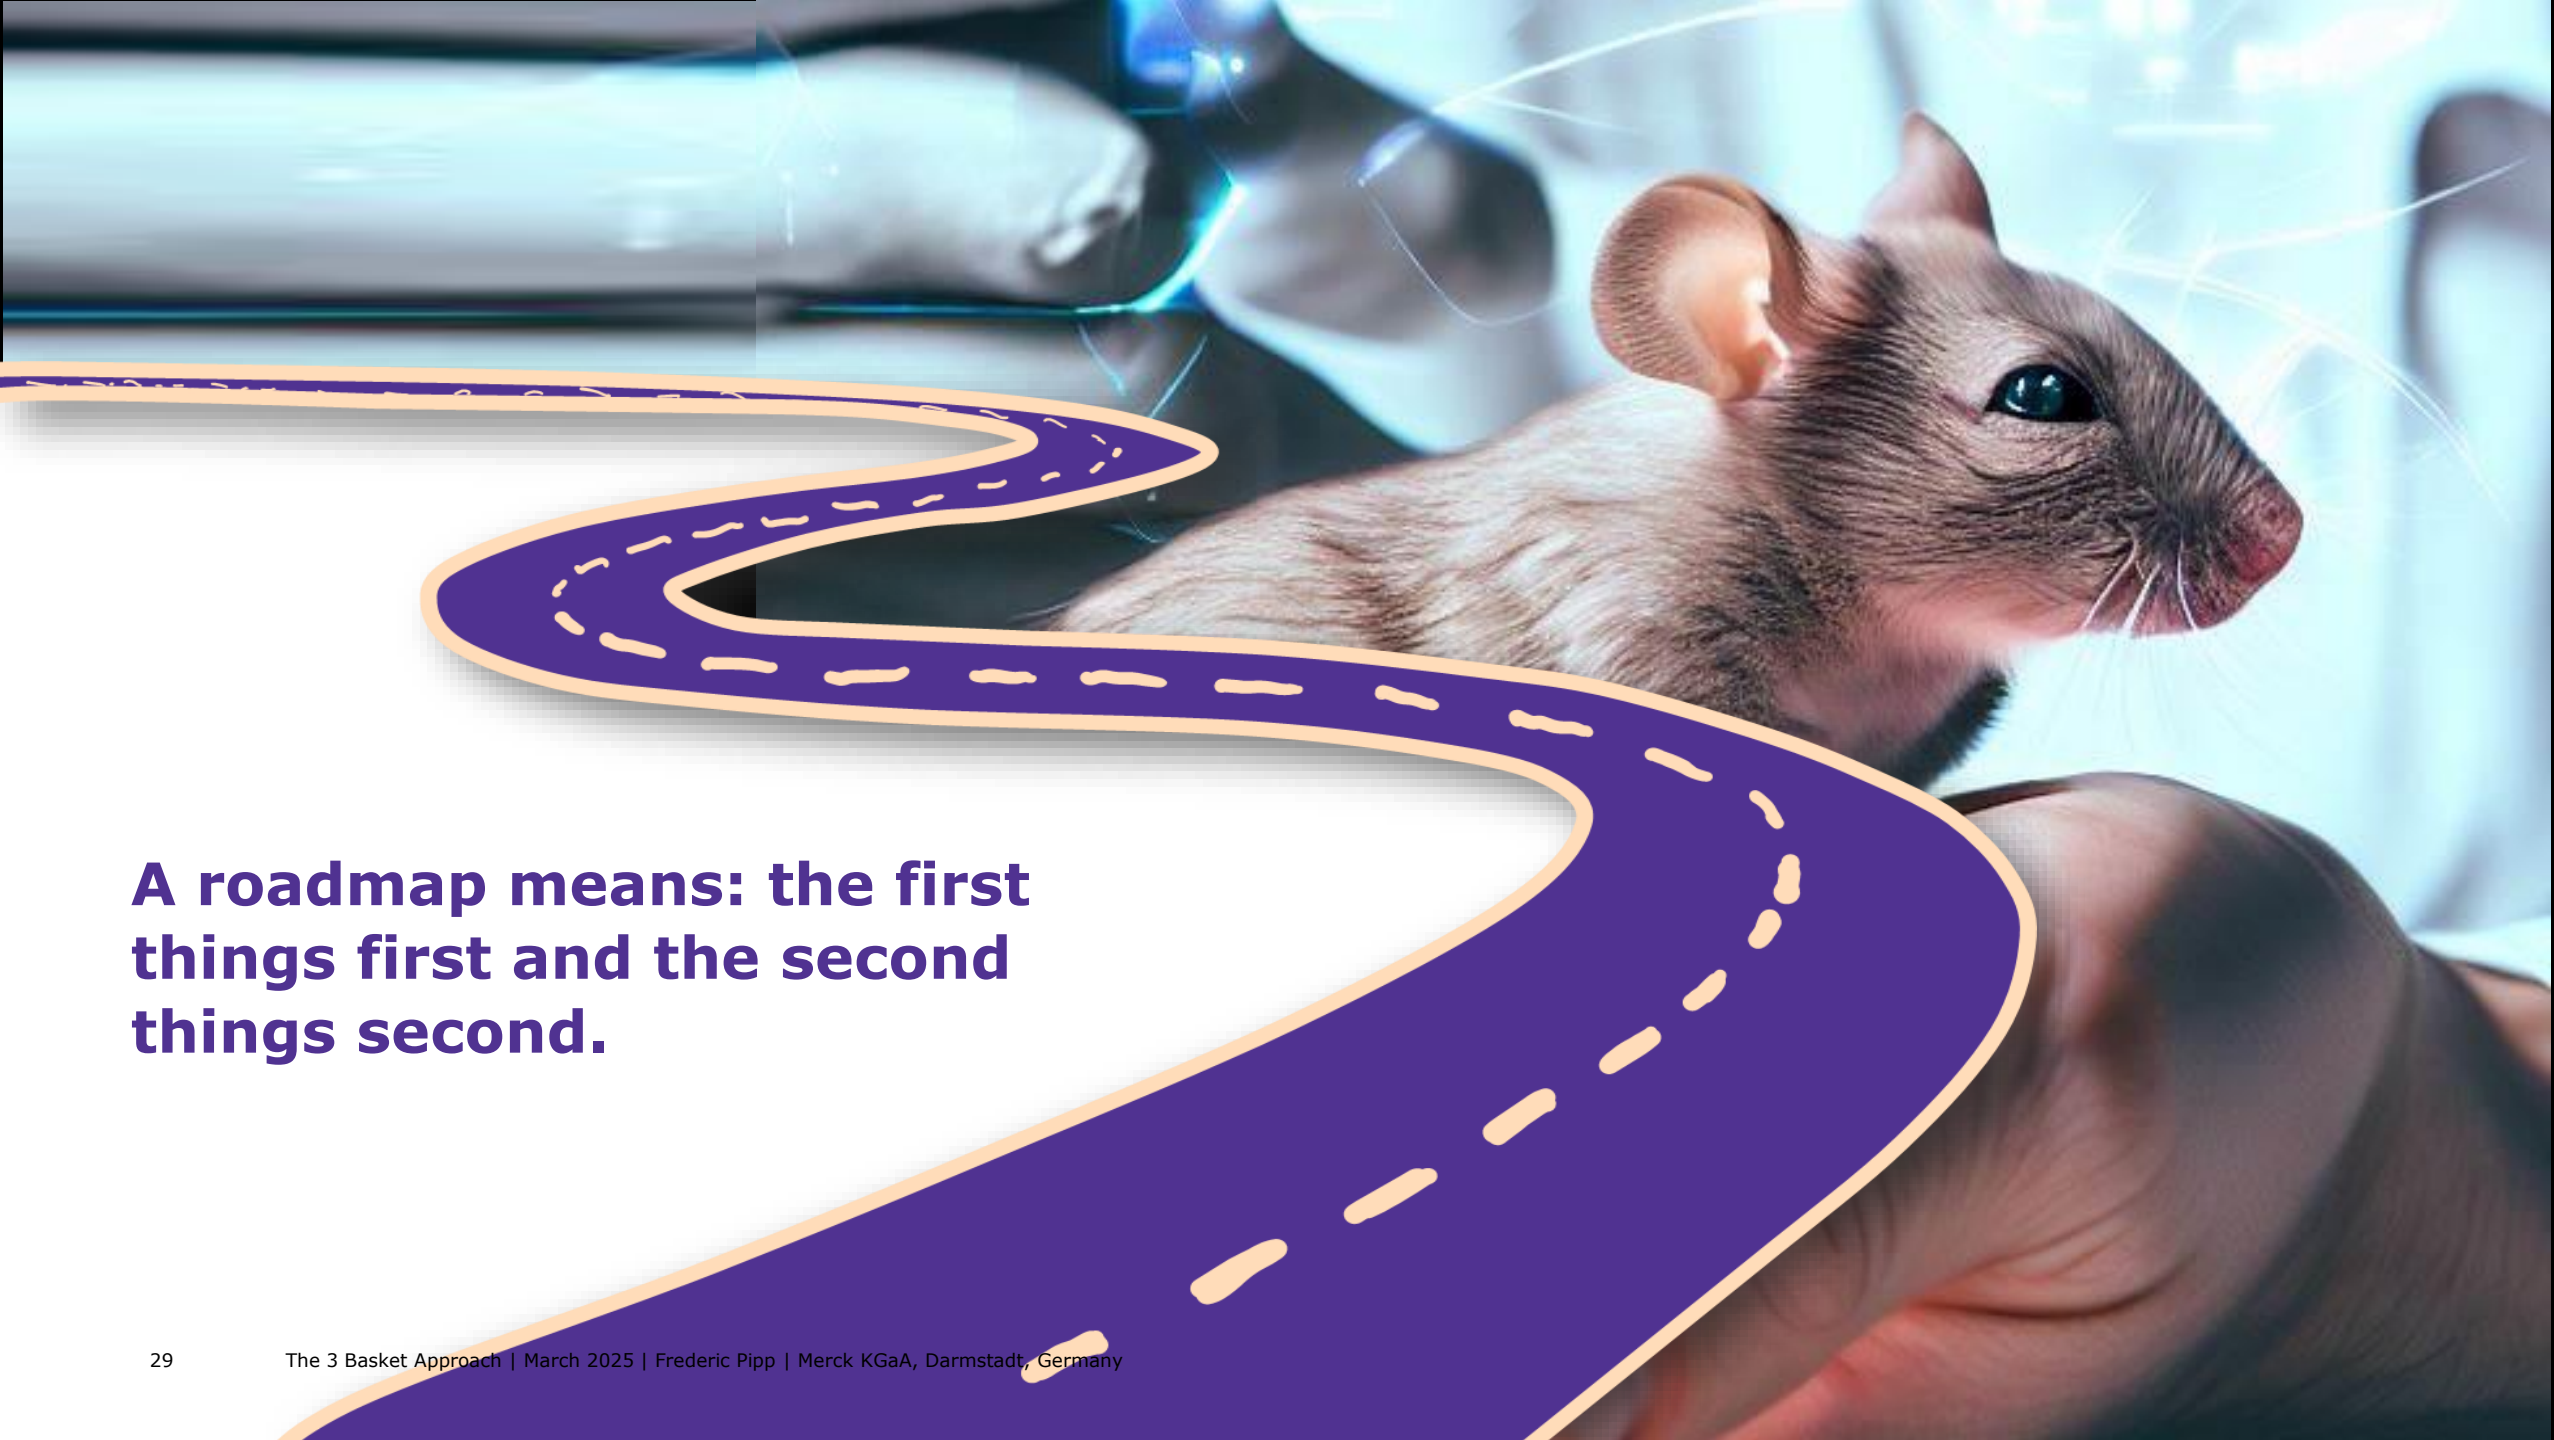
THE Alternative
to animal testing

Just as there is no

THE Animal Test

…and we don´t have
all the solutions yet

Focus on what we can do today, rather than blocking development with discussing what we cannot yet do.



A roadmap means: the first things first and the second things second.

BASKET 1
Alternatives Exist

Animal testing purposes for which, from a scientific standpoint, there are non-animal alternatives. This includes animal experiments mandated by regulatory authorities in one or more countries.

BASKET 2
Hypotheses for Alternatives Exist

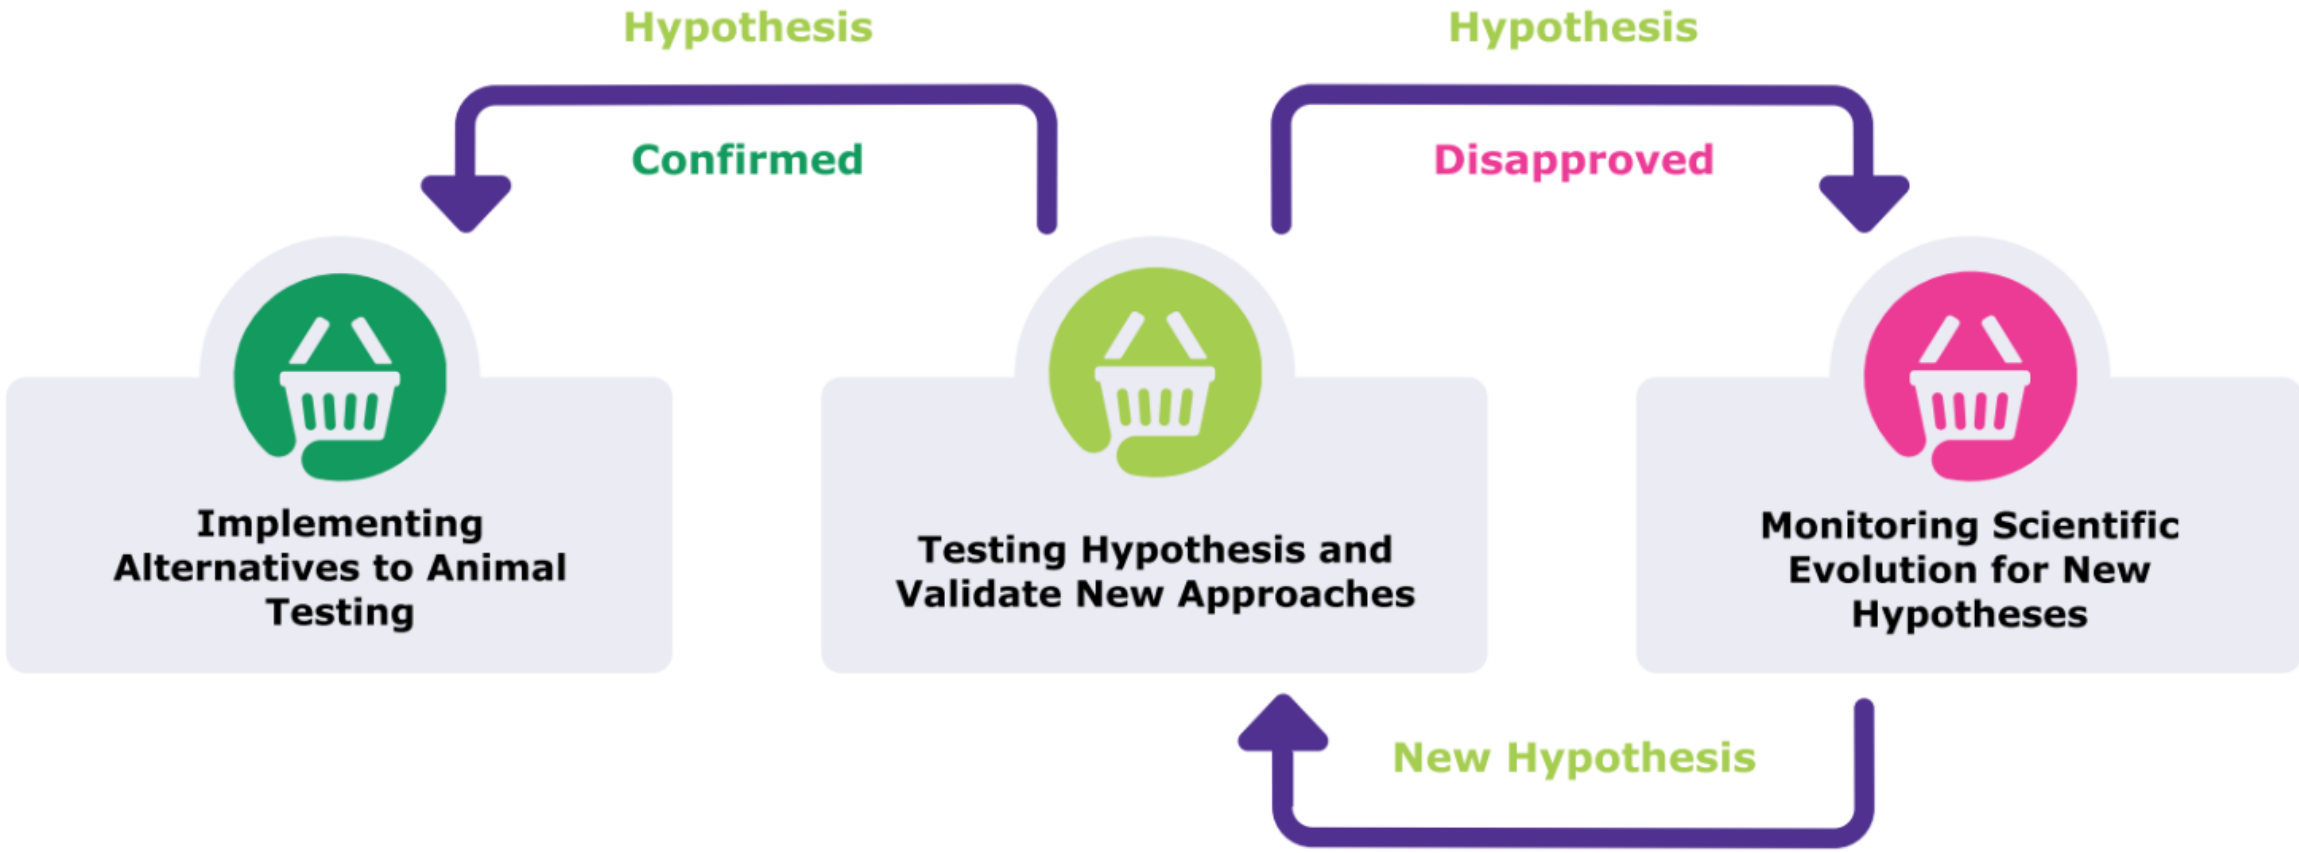
Animal testing purposes for which currently no alternatives exist, but for which hypotheses exist on how animal-free technologies may replace animal testing in the mid to long term.

BASKET 3
No Hypotheses for Alternatives Exist

Animal testing purposes for which there are currently no hypotheses on how the scientifically essential knowledge could be achieved without the use of animals.

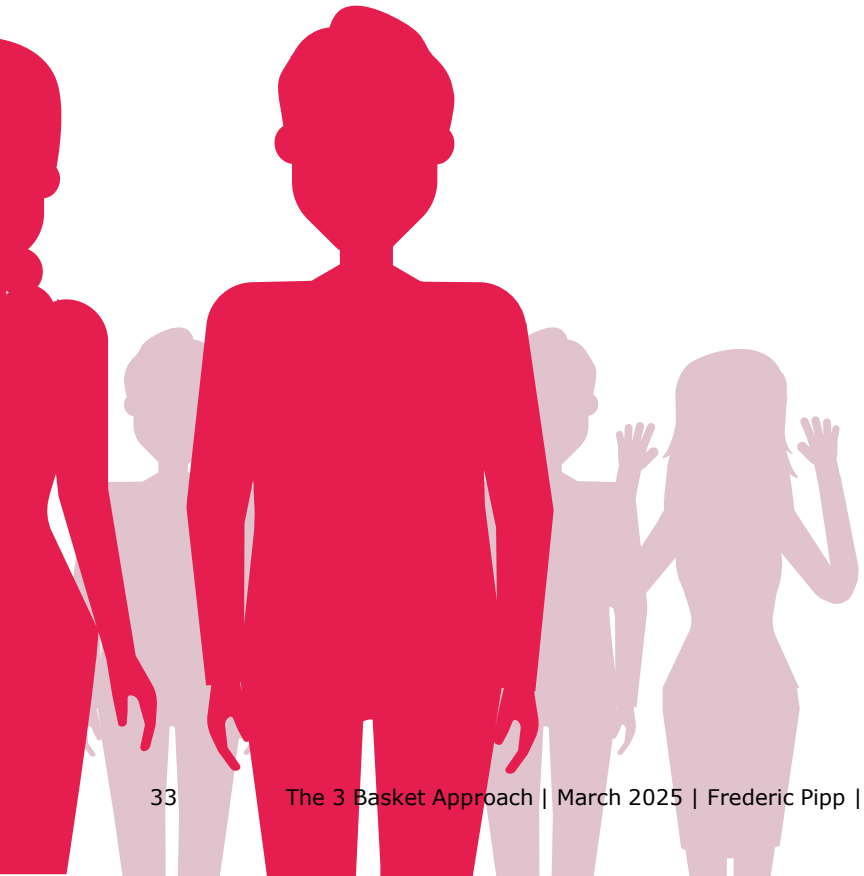
Subject Matter Experts Sort all Animal Testing Purposes into the 3 Baskets

Alternatives Exist
ADOPTION:
Roadmaps, Milestones,
KPIs
Hypotheses for
Alternatives Exist
ADAPTATION:
Prioritization of
Research Investments
No Hypotheses for
Alternatives Exist
ASSESSMENT:
Greatest Innovation
Potential
Investment Priority: Refine
Investment Priority: Replace



Hypothesis
Confirmed
Hypothesis
Disapproved
Implementing Alternatives to Animal Testing
Testing Hypothesis and Validate New Approaches
Monitoring Scientific Evolution for New Hypotheses
New Hypothesis

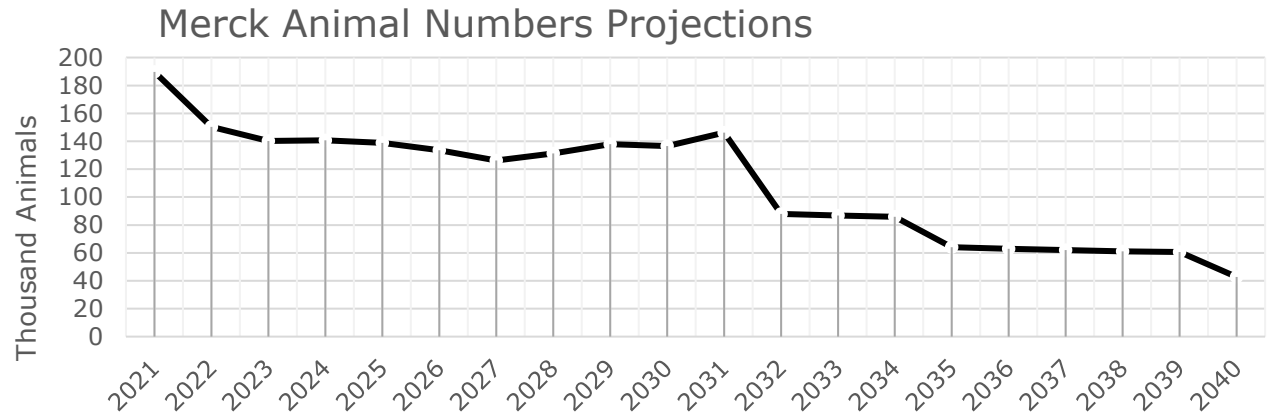
When will we no longer need to conduct animal testing?



That we don´t know.

But we do know that the 3 Basket Approach helps us replacing 75% by 2040, despite the growing business needs.

While creating business advantage.



One-Merck Projected Reduction of Animals Used in Testing Through the 4R Program Launched in 2021.

-50% animals by 2032

-75% animals by 2040

3 Basket Model adoption

Feasible Roadmap
Replacement – not Displacement

Basket 1 → Replacement
Biggest hurdle is global acceptance of alternative methods

Basket 2 → Innovation
Basket 3 → Acceptance

EFPIA - European Federation of Pharmaceutical Industri...

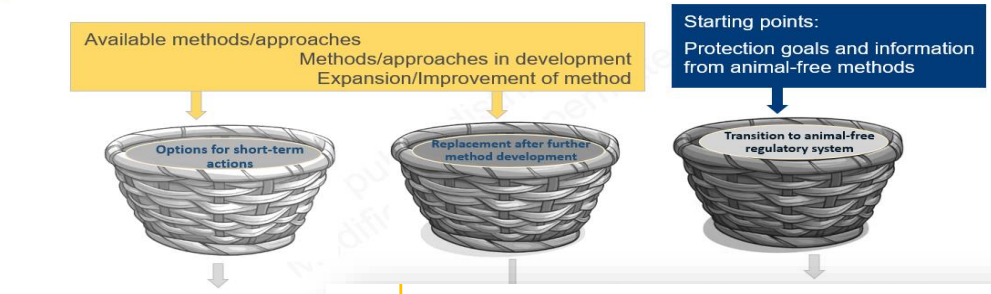
1w •

EFPIA is committed to a science-based phase-in of methods to reduce, refine and replace the use of animals. As part of our efforts, EFPIA has taken forward the #3 #Basket approach to support the European Commission in the creation of their #roadmap on the #phase #out of #animals in chemical safety #testing, to reduce reliance on animal testing in the pharmaceutical industry. Today, we are pleased to bring together stakeholders, the European Medicines Agency and the Commission

Exciting: European Commission adopts 3 Baskets

Elements of the roadmap – three baskets



Recommend short-term replacer

Prio
Exp
Rec

11

Elements of the roadmap – three baskets

- Currently, COM WGs on Human Health and Environmental Safety Assessments are identifying potential methods/approaches for 1st and 2nd basket and discuss the way forward to fill the 3rd basket
- Expectation for roadmap:
  - 1st basket: Recommendations for short-term replacements
  - 2nd basket: Recommendations for methods/approaches to be further developed or expanded
  - 3rd basket: Recommendations for performance criteria for future methods/approaches
    Identification of the necessary organisational structures for sustaining the development of animal-free system

→ **Introduction of recommendations into legislation to follow the normal processes (e.g. nt authorities subgroup under pharma legislation + legislative**

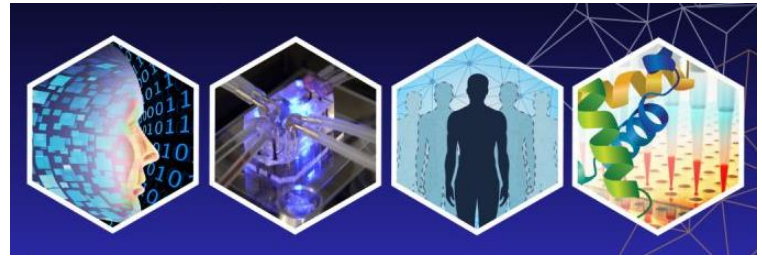
NIH/FNIH Public-Private Partnership

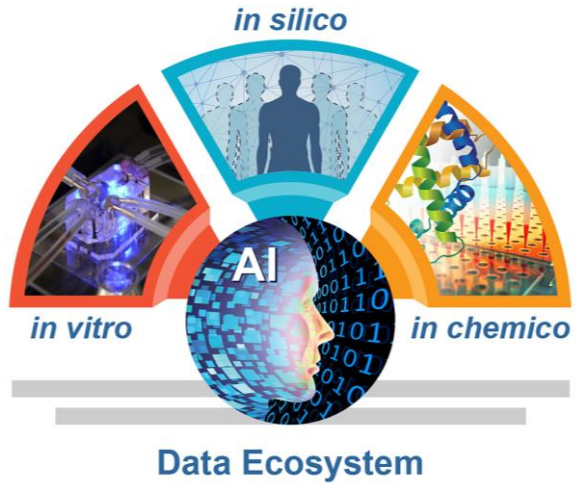
Validation and Qualification Network (VQN) for the Adoption and Implementation of New Approach Methodologies (NAMs)

- Developing an NIH/FNIH Public-Private Partnership to bring industry, NGOs, non-profits, etc. into the network leveraging existing FNIH PPP infrastructure
- Pre-competitive data sharing and potentially supporting validation activities across labs and locations for specific use cases for implementation
- Support community outreach and training
- Provide a fluid funnel for potential solutions which may be developed through the comprehensive centers
- Include additional Federal partners
- Synergize and coordinate with other global activities on NAMs



Goals of the Complement Animal Research In Experimentation Program **(Complement-ARIE)**

Purpose: To catalyze the development, standardization, validation and use of **human-based new approach methodologies (NAMs)** that will transform the way we do basic, translational, and clinical sciences

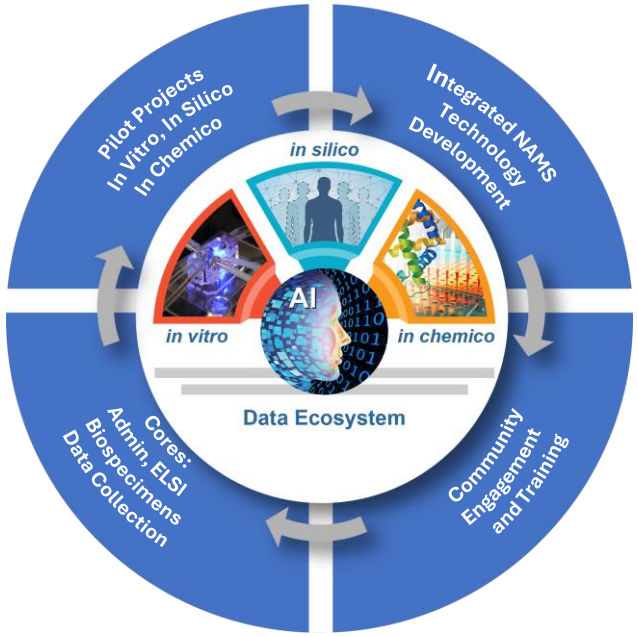


Goals:

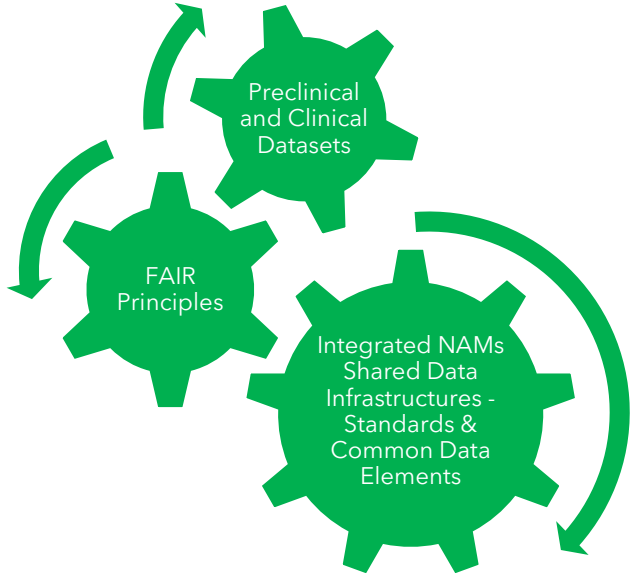
1. Better model and **understand human health and disease** outcomes **across diverse populations**.
2. Develop NAMs that **provide insight into specific biological processes** or disease states.
3. Validate mature NAMs to **support regulatory use** and standardization.
4. Complement traditional models and **make biomedical research more efficient and effective**.

Summary: Complement-ARIE Consortium

NAMs Tech Dev Centers

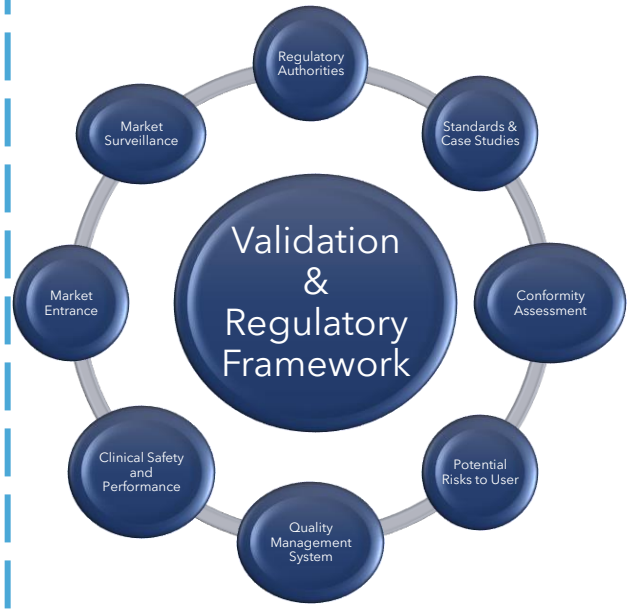


NAMs Data Hub and Coordinating Center



Validation and Qualification Network

FNIH

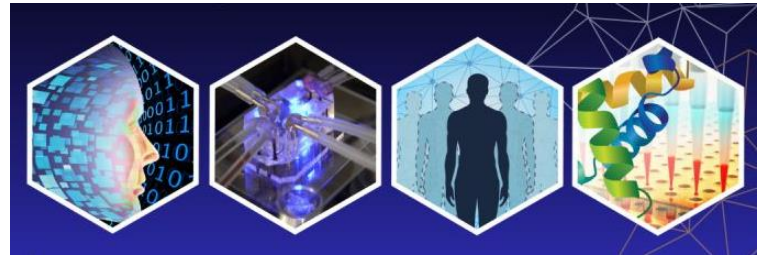


- Regulatory Partners
- Industry Partners
- ICCVAM/Other Agencies
- International Partners
- Non-Profits
- Other end users

FNIH

Validation and Qualification Network (VQN) will:

- Accelerate the implementation and adoption of NAMs in research and regulatory contexts by **ensuring NAMs are robust, reliable, and reproducible**
- Demonstrate **biological relevance of NAMs** to ensure each NAM is “fit for purpose”
- Multi-pronged approach:
  - Replication of key experiments
  - Establish common data elements and standardized reporting
  - Ensure NAMs have well-described protocols
  - Conduct quality assessment



VQN Timeline: A Phased Approach

1

DESIGN
(FY25)

- Plan, develop network with Industry, NGOs, CROs and fed partners
- Determine scope of validation efforts
- Develop governance/criteria selection of use cases
- Workshops with stakeholders

2

IMPLEMENTATION
Phase I
(FY26-30)

- Implement validation efforts with partners
- Select and fund 4-8 Use Case Validation studies
- Bi-annual reporting
- Coordinate with other Complement-ARIE components

3

IMPLEMENTATION
PHASE II
(FY31-35)

- Nominate mature NAMs from Complement-ARIE for Validation Network
- Apply reporting standards to new NAMs from Complement-ARIE
- Foster interactions between researchers and regulators/industry
- Training opportunities with partner orgs
